THE GLOBAL SPECIALIST
IN ELECTRICAL AND DIGITAL BUILDING INFRASTRUCTURES

legrand[®]

Overvoltages caused by lightning are responsible for 25% to 40% of all damage to equipment. If the transient overvoltages caused by other phenomena are added to this, close to 60% of all electrical damage could be avoided by installing surge protective devices (SPDs)*. This risk is increasingly included in international standards and national regulations.

With its new SPDs, add-on SPDs and SPDs with integrated protection, Legrand provides solutions suitable for all types of installations and all risk levels.

* Depending on the country and type of installation. Source: insurance companies.

A vertical image on the left side of the page. The top half shows a dark, stormy sky with a bright, jagged lightning bolt. The bottom half shows two illuminated communication towers at night, with city lights visible at their base.

New Surge Protective Devices (SPDs)

- 2 **New Legrand SPDs**, a complete range for all risk levels
- 4 **Optimum protection** and adaptability to suit local habits
- 6 **Add-on SPDs**, increased reliability and safety
- 8 **Design and functionality**, perfect integration in distribution boards

New SPDs, a complete range for all risk levels

For protection against transient overvoltages to be effective, the position of the SPD in the installation and the type of SPD must be appropriate for the level of risk. Conforming fully to international standards, Legrand's range of type 1 (T1) and 2 (T2) SPDs meet all the requirements of low voltage installations.

SPDs WITHOUT INTEGRATED PROTECTION (T1, T1+T2 AND T2)

These SPDs require associated protection by means of a circuit breaker or fuse. They are designed to protect commercial and industrial installations.

ADD-ON SPDs (T2)

The protective circuit breaker is connected directly to the SPD with no wiring (see page 13). These SPDs are designed to protect commercial and industrial installations in their secondary distribution boards.

SPDs WITH INTEGRATED PROTECTION (T2)

Protection against overloads and short-circuits is incorporated in the SPD. This is the most straightforward choice for small commercial or residential installations. It also provides the warranty of having the ideal match between the SPD and its associated protection, for maximum safety.

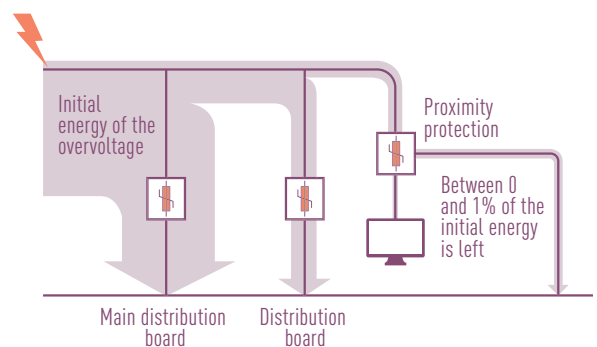

STANDARDS EN 61643-11 AND IEC 61643-11

The entire range of Legrand SPDs conforms to standards EN and IEC 61643-11. The standards distinguish two types of SPD for distribution boards: T1 and T2.

T1 SPDs are designed to provide protection in the main distribution boards and T2 SPDs mostly provide protection in secondary distribution boards or consumer units. T1+T2 SPDs, which are increasingly used at the supply end of installations, comply with the specifications of both types.

CASCADED PROTECTION

The only way to discharge all the initial energy is to install SPDs at every level of the installation.

Optimum protection and adaptability to suit local habits

The new Legrand 1P+N and 3P+N SPDs ensure optimum protection for electronic equipment, while providing a universal solution suited to the installation practices of all markets. Available with all levels of discharge current.

OPTIMUM PROTECTION

The 1P+N and 3P+N SPDs with dedicated protection of the neutral pole discharge the common and differential mode overvoltages that may occur in installations with TT and TNS systems, when there is a lightning strike.

1 Dedicated protection of the neutral

ADAPTABILITY

To adapt to the installation practices of different countries, the 1P+N and 3P+N SPDs are available with the neutral on the right or on the left side.

Neutral on the right Neutral on the left

SPDS... NOT JUST PROTECTION AGAINST THE EFFECTS OF LIGHTNING

The operation of distribution networks, installations and equipment can cause very harmful transient overvoltages. As well as providing protection against the effects of lightning, installing SPDs also protects sensitive equipment against this type of disturbance.

Typical switching overvoltage

Add-on SPDs, increased reliability and safety

Exclusive to Legrand,
the add-on SPDs make
installation and maintenance
simpler and safer and enable
the associated circuit breaker
to be chosen according to the
back-up or discrimination
requirements of the
installation.

SAVE INSTALLATION TIME

The add-on SPD and its protective circuit breaker are joined together without any wiring, guaranteeing speed of installation and safety.

SIMPLER MAINTENANCE AND INCREASED SAFETY

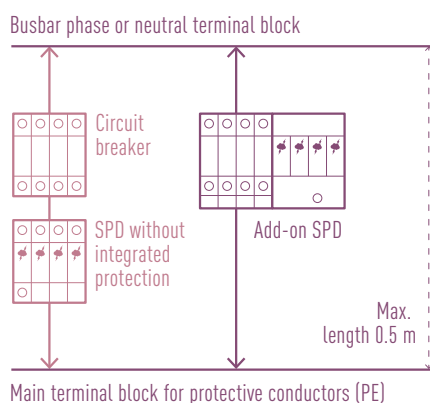

- The circuit breaker + add-on SPD assembly is joined together by a locking system.
- A single auxiliary to ascertain the status of the SPD (operational or plug-in modules out of service) and its associated circuit breaker.
- It is not possible to reset the circuit breaker if a plug-in module is missing or out of service.
- If a plug-in module is out of service, the circuit breaker remains ON and the SPD can still protect the other poles.

MORE FLEXIBILITY DUE TO THE CHOICE OF CIRCUIT BREAKERS

The add-on SPD can be used with all DX³ 1 module per pole circuit breakers, thus enabling users to choose the characteristics of the protective device, which is not possible with SPDs with integrated protection.

INCREASED RELIABILITY AND MORE EFFECTIVE PROTECTION

With no intermediate wiring between the SPD and the circuit breaker, it is easier to create the shortest possible connection between the supply terminal block and the main terminal block for protective conductors, which provides more effective protection of the equipment

1 The add-on SPD is joined to the circuit breaker simply by driving in these two locking devices.

Design and functionality, perfect integration in distribution boards

Clear, easily identifiable marking for easier maintenance, design in line with other Legrand modular equipment, well thought features: the new SPDs integrate perfectly in the modular rows of Legrand distribution boards.

Easier to handle: the plug-in modules are easy to replace thanks to the extraction handles.

STATUS INDICATOR AND REMOTE MONITORING OF INFORMATION

A plug-in module status indicator indicates whether the SPD is operational (green) or out of service (orange). The fault signal contact integrated in all add-on SPDs and available for all protection levels of conventional SPDs provides remote monitoring of this information. The fault signal contact on the add-on SPDs also indicates the status of the circuit breaker (ON/OFF).

- 1 Fault signal contact
- 2 Status indicator

DESIGN AND MARKING

New design in line with the DX³ range of circuit breakers, but with dedicated marking for easy identification of the product once installed in the distribution board.

- 3 Dedicated marking for easier identification and maintenance of the SPDs.

Selecting Surge Protective Devices (SPDs) and their associated protection

SPDs are compulsory¹:

- In all areas (apart from specific cases):
 - With lightning protection of buildings (LPS): SPDs in the main distribution boards and distribution boards
 - With IEC/EN 62305 standards
 - Commercial installations
 - Public services, hospitals
- In AQ2 areas with overhead (or partially overhead) lines

Group or individual houses, small commercial buildings

Risk levels:

- **Very high risk:** EN/IEC 62305 standards, installations with a LPS or metal structure (acting as a lightning conductor), installations that are isolated, or on a high mountain, or have a history of lightning strikes, etc.
- **High risk:** installations outside of urban areas, in mountainous areas, isolated, at the end of a line, near a body of water, trees or near installations equipped with lightning conductors, etc.
- **Low risk:** installations in urban areas (or grouped buildings), flat areas, or low and medium height mountains

Surge Protective Devices (SPDs)

protection against transient overvoltages

Protection against lightning and overvoltages

Protection against the effects of lightning is essentially based on:

- Protecting buildings using a lightning protection system (LPS or lightning conductors) to catch lightning strikes and to drive the lightning current to earth.
- The use of surge protective devices (SPDs) to protect equipment.
- The design of the earthing system (passive protection of the installation).

Throughout the world, there are millions of lightning strikes each day in the summer (up to 1000 lightning strikes/second). Lightning is responsible for 25% to 40% of all damage to equipment. When added to industrial overvoltages (switching overvoltages due to the operation of internal equipment), they account for more than 60% of all electrical damages, which can be prevented by installing SPDs (according to the country and type of installation - source: insurance companies).

In some countries, and depending on the end use of the building, national regulations may always stipulate the installation of SPDs (for example, Germany, Austria, Norway, etc.). If there are no specific national regulations, SPDs are usually specified by national installation standards (based on HD/IEC 60364 international installation standards) and EN/IEC 62305 standards.

External lightning protection system (LPS) or lightning conductors: protection of buildings (EN/IEC 62305)

An external lightning protection system (LPS) protects buildings against direct lightning strikes. It is generally based on the use of lightning conductors (single rod, with sparkover device, meshed cage, etc.) and/or the metallic structure of the building.

If there is an LPS or if a lightning risk assessment has been carried out in accordance with EN/IEC 62305 standards, SPDs are generally required in the main distribution board (T1 SPDs) and distribution boards (T2 SPDs).

Determination of the SPDs in the main distribution board in accordance with EN/IEC 62305 and TS/IEC 61643-12 (if there is insufficient information available):

LPL: Lightning protection level	Total lightning current of the LPS	Min. value of Imp current of the SPD (T1)	Usage practices
I	200 kA	25 kA/pole (IT: 35kA min.)	Power installations
II	150 kA	18.5 kA/pole	Rarely used
III/IV	100 kA	12.5 kA/pole	Small installations

1: LPL (Lightning Protection Level)

Surge protective device (SPD) (internal protection)

The SPD

- Protects sensitive devices against overvoltages caused by lightning and industrial overvoltages, by limiting the overvoltages to values that are tolerated by the equipment
- Limits the possible harmful consequences in terms of the safety of people (medical equipment installed in the home, security systems, environmental systems, etc.)
- Maximises the continuity of operation of equipment and limits production losses

SPDs and standards

Standards EN/IEC 61643-11

Type of SPD		Test waves
EN 61643-11	IEC 61643-11	
Type 1 (T1)	Class I (T1)	limp: 10/350 μ s (discharge current) In: 8/20 μ s (nominal current, 15 shocks)
Type 2 (T2)	Class II (T2)	Imax: 8/20 μ s (discharge current) In: 8/20 μ s (nominal current, 15 shocks)

T1+T2 SPDs: tested in accordance with both methods.

T1 or T1+T2 SPDs are being increasingly used at the supply origin of installations, even when there is no lightning conductor, as they enable higher energies to be discharged and increase the service life the SPD.

HD/IEC 60364 electrical installation standards

According to articles 443 and 534 of HD/IEC 60364 standards and the TS/IEC 61643-12 guides, the use of SPDs in new or renovated buildings is compulsory at the supply origin of the installation in the following cases:

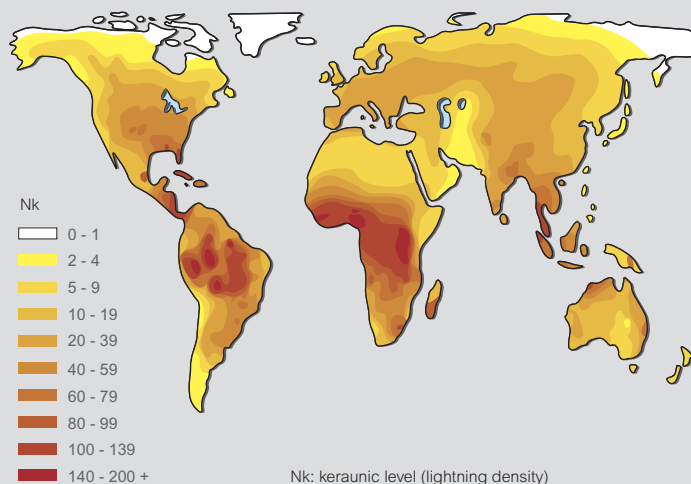

- Buildings with lightning conductors (T1 SPDs, limp \geq 12.5 kA)
- Buildings with totally or partially overhead power supplies in AQ2 geographical areas (article 443.3.2.1 - AQ2: Nk > 25, see map below) and based on a risk assessment taking into account the type of power supply to the building (article 443.3.2.2)

According to article 443.3.2.2, SPDs (Type 2) are also required in the following cases:

- Commercial/industrial buildings, public buildings and services, religious buildings, schools and large residential complexes, etc.
- Hospitals and buildings containing medical equipment and/or security systems for people and property (fire alarm, technical alarms, etc.)

Important: it is advisable to install an SPD when the safety of people may depend on the continuity of service of equipment (even if this is not required by national standards). Although not compulsory according to the installation standards, an SPD should always be installed to protect the communication equipment when there is an SPD on the low voltage power network.

These rules should change in 2015. Please consult Legrand.

Protection of distribution boards and sensitive equipment (cascaded protection)

Effective protection against overvoltages cannot generally be assured with a single SPD if its protection level (Up) is greater than 1.2 kV (EN/IEC 62305 and TS/IEC 61643-12).

When there are overvoltages, an SPD protects equipment by limiting these overvoltages to values that can be tolerated by the equipment. Thus, depending on its discharge capacity (discharge current In, Imax, etc.) and its protection level (Up), an SPD will limit these overvoltages to varying values depending on the energy levels involved. The overvoltage values that may be transmitted downstream of the SPD may double over distances of more than 10 m due to resonances associated with the type of electrical installation and the type of equipment. Overvoltages greater than 2.5 kV may then occur and damage equipment if the residual energy is high enough (2.5 kV being the insulation level of most electrical and electronic equipment, or typically 1.5 kV for electrical domestic appliances).

SPDs should be installed in the distribution boards supplying equipment that is sensitive or critical for the activity being carried out (and/or near to equipment with proximity SPDs).

Surge Protective Devices (SPDs)

technical characteristics

Modular SPDs

230/400 V~ power network (50/60 Hz) - Degree of protection IP 20

U _{oc}	3 kV

Installation

Associated overcurrent protection

SPDs must be protected by a circuit breaker (or fuses), to provide protection in the event of an overload, which may make the SPD reach its end of life (see selection table p. 10-11). This protective device will be defined to be coordinated or discriminating with regard to upstream protective devices.

Connection principles

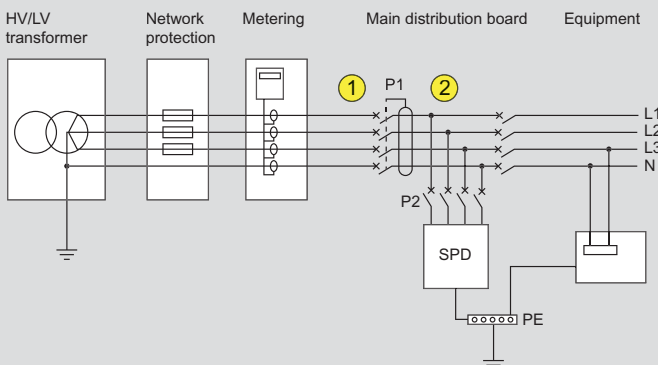

Connection lengths: as short as possible (< 50 cm if possible).

EMC (Electromagnetic Compatibility) rules: avoid loops, fix the cables firmly against the exposed metal conductive parts of the enclosure.

SPD types and earthing systems

When possible (according to local rules), the SPD and its associated overcurrent protection (P2) should be installed upstream of the main protection (P1) as shown below (according to standards HD/IEC 60364).

SPDs and TT earthing system

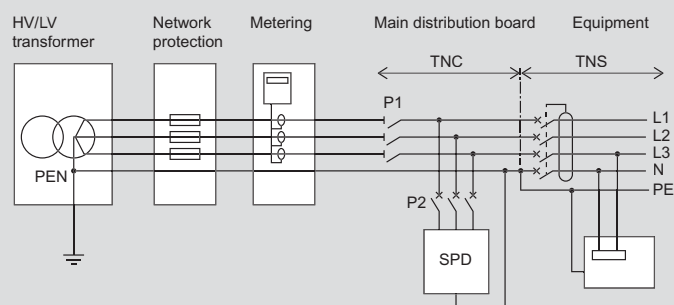

P1: main protection of the installation

SPD: surge protective device with U_c 275 or 320 V recommended

① (upstream of P1): 1P+N/3P+N SPDs only (except for Cat.Nos 0 039 51/53/71/73). 1P/2P/3P/4P SPDs and Cat.Nos 0 039 51/53/71/73 must always be installed downstream of a residual current device (discriminating or delayed, at the supply end of the installation).

② (downstream of P2): any SPD.

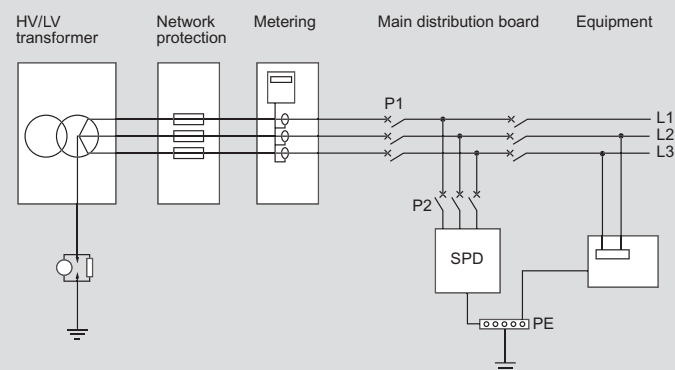

SPDs and TN (TNC, TNS and TNC-S) earthing systems

P1: main protection of the installation

SPD: surge protective device with U_c 275 or 320 V recommended

SPDs and IT earthing system

P1: main protection of the installation

SPD: surge protective device with U_c 440 V ($U_c < 440$ V prohibited)

Coordinating upstream/downstream SPDs

Consists of ensuring that any downstream SPD (in distribution enclosures or proximity SPDs) is correctly coordinated in energy terms with any SPD located upstream (TS 61643-12).

Minimum distances between SPDs

Upstream SPD	Downstream SPD	Min. distance (m)
T1/50 and T1/25	T2/40	10
	T2/40	6
T1/12.5 and T1/8	T2/20, T2/12	8
	T2/20	4
T2/40	T2/12	6
T2/20 and T2/12	Proximity SPD	2

If it is not possible to comply with these distances, insert decoupling inductors on each phase and neutral conductor.
